Scientific Computing for Differential Equations

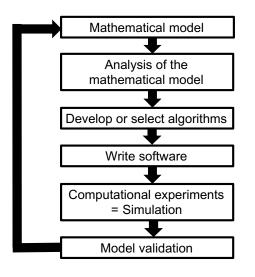

Lecture 01A - Overview of models and methods

John Bagterp Jørgensen

Department of Applied Mathematics and Computer Science Technical University of Denmark

02686 Scientific Computing for Differential Equations

Steps in Applied Mathematics

▶ Mathematical model

Use physical, chemical, biological and economical principles to develop a system of differential equations that approximately describes the problem studied.

- ► Analysis of the mathematical model
 Determine the type of model and the
 appropriate methods for solving it.
- ► Develop or select algorithms
 Use library algorithms or develop new algorithms for solving the differential equations that model the system.
- ► Write software Implement the algorithm in software.

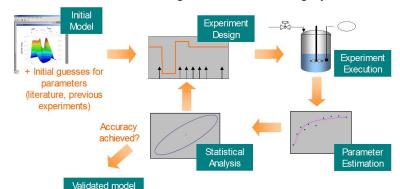

▶ Simulation

Run the software on instances of the problem to understand the model and to use the model to answer engineering questions (design, operation, etc).

► Model validation

Interpret the results of the simulation and decide if the model adequate or need to be revised.

Systematic Mathematical Modeling - The Model Building Cycle

Mathematical model

$$\hat{x}(t_0) = x_0$$

$$\frac{d\hat{x}}{dt}(t) = f(\hat{x}(t), u(t), p)$$

$$\hat{y}(t_k) = g(\hat{x}(t_k), p)$$

Data

- ightharpoonup Measurements: $y(t_k)$
- $\blacktriangleright \;\; \mathsf{Error} \colon \, e(t_k) = \hat{y}(t_k) y(t_k)$
- Least-squares error metric: $V = \frac{1}{2} \sum_{k} \|e(t_k)\|_2^2$
- Adjust the parameters, p, such that the model fits the data best possible

Computational Tasks in Systematic Model Building

► Simulation = solution of intitial value problems in the form

$$\hat{x}(t_0) = x_0 \tag{1a}$$

$$\frac{d}{dt}\hat{x}(t) = f(t, \hat{x}(t), p) \tag{1b}$$

$$\hat{y}(t_k) = g(\hat{x}(t_k), p) \tag{1c}$$

► Parameter estimation = optimization problem with ODEs

$$\min_{p} V(p) = \frac{1}{2} \sum_{k} \|\hat{y}(t_k, p) - y(t_k)\|_2^2$$
 (2a)

$$s.t. \hat{x}(t_0) = x_0 (2b)$$

$$\frac{d}{dt}\hat{x}(t,p) = f(t,\hat{x}(t,p),p) \tag{2c}$$

$$\hat{y}(t_k, p) = g(\hat{x}(t_k, p), p) \tag{2d}$$

$$p_l \le p \le p_u \tag{2e}$$

Mathematical Modeling with Differential Equations

Conservation Principle

Physical models are based on conservation principles.

- 1. Conservation of mass
- 2. Conservation of energy
- 3. Conservation of momentum (force)

The general derivation of the system equations have the form

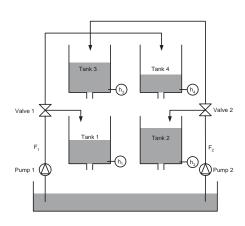

For non-reactive systems the generation term is absent

Accumulated = Influx - Outflux

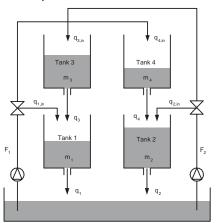

4-Tank System

4-Tank System - Motivating Example

Example - Tank 1

Accumulated = In - Out

with

$$\label{eq:accumulated} \begin{split} \mathsf{Accumulated} &= m_1(t+\Delta t) - m_1(t) \\ \mathsf{In} &= \rho q_{1,in}(t) \Delta t + \rho q_3(t) \Delta t \\ \mathsf{Out} &= \rho q_1(t) \Delta t \end{split}$$

$$\underbrace{m_1(t+\Delta t)-m_1(t)}_{\text{Accumulated}} = \underbrace{\rho q_{1,in}(t)\Delta t + \rho q_3(t)\Delta t}_{\text{In}} - \underbrace{\rho q_1(t)\Delta t}_{\text{Out}}$$

Example - Tank 1

1. Conservation of mass

$$\underbrace{m_1(t+\Delta t)-m_1(t)}_{\text{Accumulated}} = \underbrace{\rho q_{1,in}(t)\Delta t + \rho q_3(t)\Delta t}_{\text{In}} - \underbrace{\rho q_1(t)\Delta t}_{\text{Out}}$$

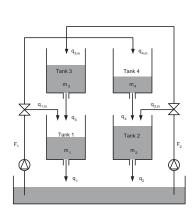

2. Divide by Δt

$$\frac{m_1(t + \Delta t) - m_1(t)}{\Delta t} = \rho q_{1,in}(t) + \rho q_3(t) - \rho q_1(t)$$

3. Let $\Delta t \to 0$

$$\frac{dm_1(t)}{dt} = \rho q_{1,in}(t) + \rho q_3(t) - \rho q_1(t)$$

4-Tank System - Model

Mass balances

$$\frac{dm_1}{dt}(t) = \rho q_{1,in}(t) + \rho q_3(t) - \rho q_1(t) \qquad m_1(t_0) = m_{1,0}$$

$$\frac{dm_2}{dt}(t) = \rho q_{2,in}(t) + \rho q_4(t) - \rho q_2(t) \qquad m_2(t_0) = m_{2,0}$$

$$\frac{dm_3}{dt}(t) = \rho q_{3,in}(t) - \rho q_3(t) \qquad m_3(t_0) = m_{3,0}$$

$$\frac{dm_4}{dt}(t) = \rho q_{4,in}(t) - \rho q_4(t) \qquad m_4(t_0) = m_{4,0}$$

Inflows

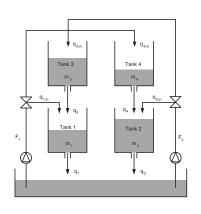

$$q_{1,in}(t) = \gamma_1 F_1(t) \qquad q_{2,in}(t) = \gamma_2 F_2(t)$$

$$q_{3,in}(t) = (1 - \gamma_2) F_2(t) \qquad q_{4,in}(t) = (1 - \gamma_1) F_1(t)$$

Outflows

$$q_i(t) = a_i \sqrt{2gh_i(t)}$$
 $h_i(t) = \frac{m_i(t)}{\rho A_i}$ $i \in \{1, 2, 3, 4\}$

4-Tank System - Model

System of ordinary differential equations

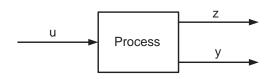

$$\dot{x}(t) = f(x(t), u(t), p)$$
 $x(t_0) = x_0$

with the vectors defined as

$$x = \begin{bmatrix} m_1 \\ m_2 \\ m_3 \\ m_4 \end{bmatrix} \quad u = \begin{bmatrix} F_1 \\ F_2 \end{bmatrix}$$
$$p = \begin{bmatrix} a_1 \ a_2 \ a_3 \ a_4 \ A_1 \ A_2 \ A_3 \ A_4 \ \gamma_1 \ \gamma_2 \ g \ \rho \end{bmatrix}^T$$

This is a non-stiff ODE system as all processes take place on the same time-scale

Generic Input-Output Model

$$\frac{dx(t)}{dt} = f(x(t), u(t), p) \qquad x(t_0) = x_0 \qquad \text{Process model}$$

$$y(t) = g(x(t), p) \qquad \qquad \text{Sensor function}$$

$$z(t) = h(x(t), p) \qquad \qquad \text{Output function}$$

Simulation in Matlab

The model

$$\dot{x}(t) = f(t, x, u, p) \qquad x(t_0) = x_0$$

may be implemented in Matlab as

```
function xdot = ProcessModel(t,x,u,p)
% Process Model     dx/dt = f(t,x,u,p)
%
% Computes the RHS of dx/dt = f(t,x,u,p)
% It stores the result in xdot.
```

and called using

```
[T,X] = ode45(@ProcessModel,[t0 tf],x0,odeOptions,u,p)
```

Model for the 4-Tank System

```
function xdot = FourTankSystem(t,x,u,p)
% FOURTANKSYSTEM Model dx/dt = f(t,x,u,p) for 4-tank System
% This function implements a differential equation model for the
% 4-tank system.
% Syntax: xdot = FourTankSystem(t,x,u,p)
% Unpack states, MVs, and parameters
     = x:
                                 % Mass of liquid in each tank [g]
                                 % Flow rates in pumps [cm3/s]
     = u:
   = p(1:4,1);
                                % Pipe cross sectional areas [cm2]
     = p(5:8,1);
                                % Tank cross sectional areas [cm2]
gamma = p(9:10,1);
                                % Valve positions [-]
     = p(11.1):
                                % Acceleration of gravity [cm/s2]
rho = p(12,1);
                                 % Density of water [g/cm3]
% Inflows
qin = zeros(4,1);
qin(1,1) = gamma(1)*F(1);
                                % Inflow from valve 1 to tank 1 [cm3/s]
                          % Inflow from valve 2 to tank 2 [cm3/s]
qin(2,1) = gamma(2)*F(2);
gin(3.1) = (1-gamma(2))*F(2):
                                % Inflow from valve 2 to tank 3 [cm3/s]
qin(4,1) = (1-gamma(1))*F(1);
                                 % Inflow from valve 1 to tank 4 [cm3/s]
% Outflows
h = m./(rho*A):
                                % Liquid level in each tank [cm]
                                 % Outflow from each tank [cm3/s]
qout = a.*sqrt(2*g*h);
% Differential equations
xdot = zeros(4,1);
xdot(1,1) = rho*(qin(1,1)+qout(3,1)-qout(1,1));
                                                 % Mass balance Tank 1
xdot(2,1) = rho*(qin(2,1)+qout(4,1)-qout(2,1));
                                                % Mass balance Tank 2
xdot(3,1) = rho*(qin(3,1)-qout(3,1));
                                                 % Mass balance Tank 3
xdot(4,1) = rho*(qin(4,1)-qout(4,1));
                                                 % Mass balance Tank 4
```

Sensor function

Sensors measuring the level (height) of all tanks

$$y = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{bmatrix} = \begin{bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{bmatrix} = \begin{bmatrix} \frac{m_1}{\rho A_1} \\ \frac{m_2}{\rho A_2} \\ \frac{m_3}{\rho A_3} \\ \frac{m_4}{\rho A_4} \end{bmatrix} = g(x, p)$$
(3)

Matlab implementation

```
function y = FourTankSystemSensor(x,p)
% FOURTANKSYSTEMSENSOR Level for each tank in the four tank system
%
% Syntax: y = FourTankSystemSensor(x,p)

% Extract states and parameters
m = x;
A = p(5:8,1);
rho = p(12,1);
% Compute level in each tank
rhoA = rho*A;
y = m./rhoA;
```

Output function

In this case the output is the level (height) in tank 1 and tank 2

$$z = \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} h_1 \\ h_2 \end{bmatrix} = \begin{bmatrix} \frac{m_1}{\rho A_1} \\ \frac{m_2}{\rho A_2} \end{bmatrix} = h(x, p) \tag{4}$$

Matlab implementation

```
function z = FourTankSystemOutput(x,p)
% FOURTANKSYSTEMOUTPUT Level for the lower tanks in the four tank system
%
% Syntax: z = FourTankSystemOutput(x,p)
% Extract states and parameters
m = x(1:2,1);
A = p(5:6,1);
rho = p(12,1);
% Compute level in each tank
rhoA = rho*A;
z = m./rhoA;
```

Define Simulation Parameters

```
% ------
% Parameters
% ------
a2 = 1.2272
           %[cm2] Area of outlet pipe 2
a3 = 1.2272
           %[cm2] Area of outlet pipe 3
a4 = 1.2272
           %[cm2] Area of outlet pipe 4
A1 = 380.1327
           %[cm2] Cross sectional area of tank 1
A2 = 380.1327
           %[cm2] Cross sectional area of tank 2
A3 = 380.1327
           %[cm2] Cross sectional area of tank 3
A4 = 380.1327 %[cm2] Cross sectional area of tank 4
gamma1 = 0.45; % Flow distribution constant. Valve 1
gamma2 = 0.40;  % Flow distribution constant. Valve 2
g = 981; %[cm/s2] The acceleration of gravity
p = [a1; a2; a3; a4; A1; A2; A3; A4; gamma1; gamma2; g; rho];
```

Simulation Scenario and Simulation

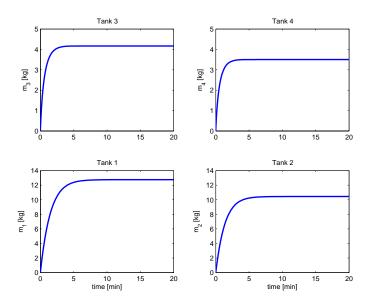

```

Computation of additional variables

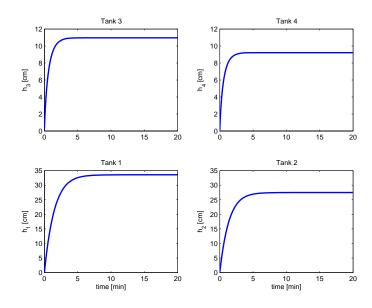

Compute additional variables for plotting

```
% help variables
[nT,nX] = size(X);
a = p(1:4,1);
A = p(5:8,1);
% Compute the measured variables
H = zeros(nT.nX):
for i=1:nT
H(i,:) = X(i,:)./(rho*A):
end
% Compute the flows out of each tank
Qout = zeros(nT,nX);
for i=1:nT
Qout(i,:) = a.*sqrt(2*g*H(i,:));
end
```

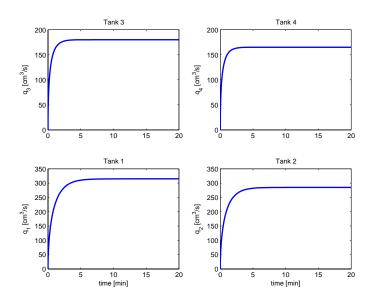

Masses in the Tanks

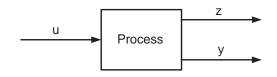

Levels in the Tanks

Outflow Rates

Discrete-Time Generic Input-Output Model

$$x_{k+1} = F(x_k, u_k, p)$$
$$y_k = g(x_k, p)$$
$$z_k = h(x_k, p)$$

Discrete-time process model Sensor function Output function

7ero-order-hold for MVs

$$u(t) = u_k \qquad t_k \le t < t_{k+1}$$

Continuous-time process model to discrete-time process model

$$F(x_k, u_k, p) = x_k + \int_{t_k}^{t_{k+1}} f(x(t), u_k, p) dt$$

Difference Equation

The difference equation

$$x_{k+1} = F(x_k, u_k, p)$$

with

$$F(x_k, u_k, p) = x_k + \int_{t_k}^{t_{k+1}} f(x(t), u_k, p) dt$$

can be computed by numerical solution of

$$\frac{dx}{dt}(t) = f(x(t), u_k, p) \qquad x(t_k) = x_k \qquad t_k \le t < t_{k+1}$$

such that

$$x_{k+1} = x(t_{k+1})$$

Discrete-Time Simulation using Matlab

The discrete-time model

$$x_{k+1} = F(x_k, u_k, p)$$
 $F(x_k, u_k, p) = x_k + \int_{t_k}^{t_{k+1}} f(x(t), u_k, p) dt$
 $y_k = g(x_k, p)$
 $z_k = h(x_k, p)$

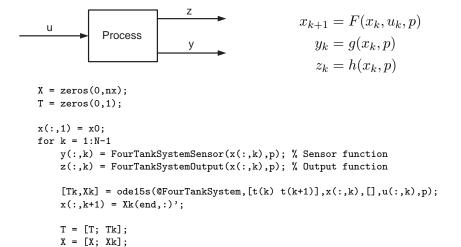

may be simulated in Matlab using

```
for i=0:N
    k=i+1;
    y(:,k) = g(x(:,k),p);
    z(:,k) = h(x(:,k),p);
    [Tk,Xk] = ode45(@f,[t(k) t(k+1)],x(:,k),odeOptions,u(:,k),p);
    x(:,k+1) = Xk(end,:)';
    T = [T; Tk];
    X = [X; Xk];
end
```

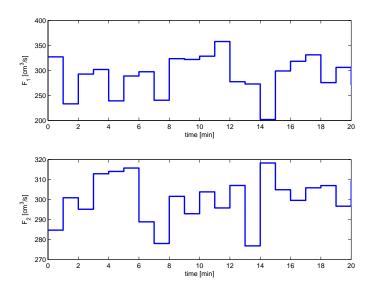

Example - 4-Tank System

y(:,k) = FourTankSystemSensor(x(:,k),p);
z(:,k) = FourTankSystemOutput(x(:,k),p);

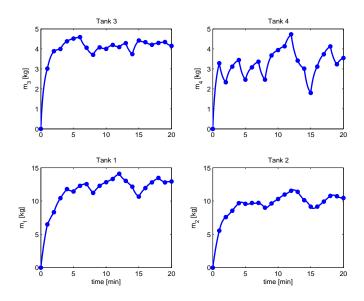

end k = N;

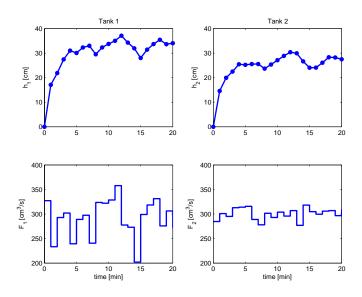

Flow Rate Scenario

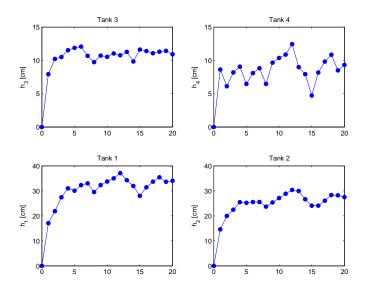

Quadruple Tank Process - States

Quadruple Tank Process - Inputs and Outputs

Quadruple Tank Process - Sensors

Stochastic Simulation

$$egin{aligned} oldsymbol{x}_{k+1} &= F(oldsymbol{x}_k, u_k, p, oldsymbol{w}_k) & ext{Process model} \ oldsymbol{y}_k &= g(oldsymbol{x}_k, p) + oldsymbol{v}_k & ext{Sensor function} \ oldsymbol{z}_k &= h(oldsymbol{x}_k, p) & ext{Output function} \end{aligned}$$

A Stochastic Realization

The stochastic variables

$$\mathbf{w}_k \sim N_{iid}(0, Q)$$
 $Q = LL'$
 $\mathbf{e}_k \sim N_{iid}(0, I)$

are related by

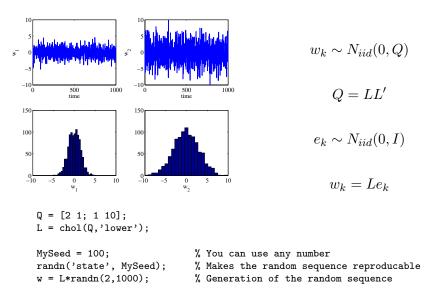

$$\boldsymbol{w}_k = L\boldsymbol{e}_k$$

As a normal distribution is completely characterized by its means and covariance, this relation can be proved by

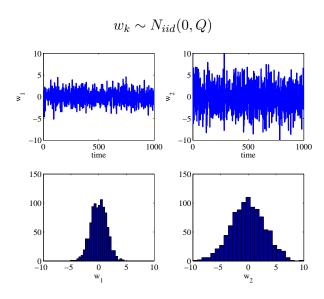

$$E\{\boldsymbol{w}_k\} = E\{L\boldsymbol{e}_k\} = LE\{\boldsymbol{e}_k\} = 0$$

$$V\{\boldsymbol{w}_k\} = \langle \boldsymbol{w}_k, \boldsymbol{w}_k \rangle = \langle L\boldsymbol{e}_k, L\boldsymbol{e}_k \rangle = L\underbrace{\langle \boldsymbol{e}_k, \boldsymbol{e}_k \rangle}_{=I} L' = LL' = Q$$

Stochastic Realization in Matlab

Stochastic Process Noise

Process noise

$$\begin{bmatrix} \boldsymbol{F}_1 \\ \boldsymbol{F}_2 \end{bmatrix} = \begin{bmatrix} F_{1s} \\ F_{2s} \end{bmatrix} + \begin{bmatrix} \boldsymbol{w}_1 \\ \boldsymbol{w}_2 \end{bmatrix}$$

$$\begin{bmatrix} F_{1s} \\ F_{2s} \end{bmatrix} = \begin{bmatrix} 300 \\ 300 \end{bmatrix} \quad \begin{bmatrix} \boldsymbol{w}_1 \\ \boldsymbol{w}_2 \end{bmatrix} \sim N_{iid} \left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 30^2 & 0 \\ 0 & 10^2 \end{bmatrix} \right)$$

Measurement noise

$$\boldsymbol{y} = \begin{bmatrix} \boldsymbol{y}_1 \\ \boldsymbol{y}_2 \\ \boldsymbol{y}_3 \\ \boldsymbol{y}_4 \end{bmatrix} = \begin{bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \end{bmatrix} + \begin{bmatrix} \boldsymbol{v}_1 \\ \boldsymbol{v}_2 \\ \boldsymbol{v}_3 \\ \boldsymbol{v}_4 \end{bmatrix} \quad \boldsymbol{v} = \begin{bmatrix} \boldsymbol{v}_1 \\ \boldsymbol{v}_2 \\ \boldsymbol{v}_3 \\ \boldsymbol{v}_4 \end{bmatrix} \sim N \begin{pmatrix} \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1^2 & 0 & 0 & 0 \\ 0 & 1^2 & 0 & 0 \\ 0 & 0 & 1^2 & 0 \\ 0 & 0 & 0 & 1^2 \end{bmatrix} \end{pmatrix}$$

Outputs

$$oldsymbol{z} = egin{bmatrix} oldsymbol{z}_1 \ oldsymbol{z}_2 \end{bmatrix} = egin{bmatrix} h_1 \ h_2 \end{bmatrix}$$

Stochastic Process Simulation - Input-Output

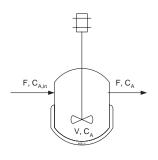

Stochastic Process Simulation - Measurements

Continuous Stirred Tank Reactor (CSTR)

Chemical reaction in a tank

Chemical Reaction in a Continuous Stirred Tank Reactor

$$A \to P$$
 $r = kC_A$

The production rate of A is

$$R_A = -r$$

Chemical Reaction in a Continuous Stirred Tank Reactor

$$Accumulated = VC_A(t + \Delta t) - VC_A(t)$$

$$Influx = FC_{A,in}(t)\Delta t$$

$$Outflux = FC_A(t)\Delta t$$

$$Generated = R_AV\Delta t \qquad R_A = R_A(C_A(t))$$

$$A \to P \qquad r = kC_A \qquad R_A = -r$$

$$Accumulated = Influx - Outflux + \overbrace{Produced - Consumed}^{Generated}$$

Generated

 $Accumulated = Influx - Outflux + Produced - \overline{Consumed}$

$$\begin{split} Accumulated &= VC_A(t + \Delta t) - VC_A(t) \\ &Influx = FC_{A,in}(t)\Delta t \\ &Outflux = FC_A(t)\Delta t \\ &Generated = R_AV\Delta t \qquad R_A = R_A(C_A(t)) \end{split}$$

1. Conservation of mass (mole balance for A):

$$VC_A(t+\Delta t)-VC_A(t) = FC_{A,in}(t)\Delta t - FC_A(t)\Delta t + R_A(C_A(t))V\Delta t$$

2. Divide by Δt and V:

$$\frac{C_A(t+\Delta t)-C_A(t)}{\Delta t} = \frac{F}{V} \left(C_{A,in}(t) - C_A(t) \right) + R_A(C_A(t))$$

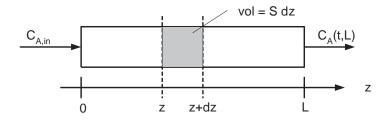

3. $\Delta t \rightarrow 0$:

$$\frac{dC_A}{dt}(t) = \frac{F}{V} \left(C_{A,in}(t) - C_A(t) \right) + R_A(C_A(t))$$

Plug Flow Reactor (PFR)

Convection-diffusion-reactive system Chemical reaction in a pipe

Flow in a Pipe

$$Accumulated = [C_A(t + \Delta t, z) - C_A(t, z)] S\Delta z$$

$$Influx = N_A(t, z) S\Delta t$$

$$Outflux = N_A(t, z + \Delta z) S\Delta t$$

Flow in a Pipe

$$Accumulated = [C_A(t + \Delta t, z) - C_A(t, z)] S\Delta z$$

$$Influx = N_A(t, z) S\Delta t$$

$$Outflux = N_A(t, z + \Delta z) S\Delta t$$

1. Conservation of mass (mole balance for A):

$$\underbrace{[C_A(t+\Delta t,z)-C_A(t,z)]\,S\Delta z}_{Accumulated} = \underbrace{N_A(t,z)S\Delta t}_{Influx} - \underbrace{N_A(t,z+\Delta z)S\Delta t}_{Outflux}$$

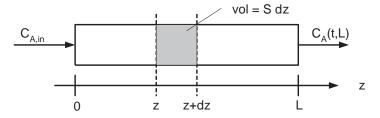

2. Divide by Δt , Δz , and S:

$$\frac{C_A(t+\Delta t,z) - C_A(t,z)}{\Delta t} = -\frac{N_A(t,z+\Delta z) - N_A(t,z)}{\Delta z}$$

3. $\Delta t \rightarrow 0$ and $\Delta z \rightarrow 0$:

$$\frac{\partial C_A}{\partial t}(t,z) = -\frac{\partial N_A}{\partial z}(t,z)$$

Differential Equation Model

$$\frac{\partial C_A}{\partial t}(t,z) = -\frac{\partial N_A}{\partial z}(t,z)$$

Initial condition

$$C_A(0,z) = C_{A0}(z) \qquad 0 \le z \le L$$

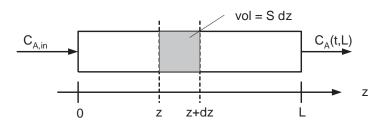

Boundary condition

$$C_A(t,0) = C_{A,in}(t)$$
 $t \ge 0$

Flux (convective flow)

$$N_A(t,z) = vC_A(t,z)$$

Flow and Chemical Reaction in a Pipe

Chemical Reaction:

$$A \to P$$
 $r = kC_A$ $R_A = -r$

Flux for convective and diffusive flow:
$$N_A = vC_A + J_A$$
 $J_A = -D_A \frac{\partial C_A}{\partial z}$

$$Accumulated = \left[C_A(t + \Delta t, z) - C_A(t, z)\right] S \Delta z$$

$$Influx = N_A(t, z) S \Delta t$$

$$Outflux = N_A(t, z + \Delta z) S \Delta t$$

$$Generated = R_A S \Delta z \Delta t$$

► Model (mass balance)

$$\frac{\partial C_A(t,z)}{\partial t} = -\frac{\partial N_A(t,z)}{\partial z} + R_A(t,z)$$

Boundary conditions

$$z = 0$$
: $N_A(t, 0) = vC_{A,in}$
 $z = L$: $N_A(t, L) = vC_A(t, L)$

► Initial condition

$$t = 0$$
: $C_A(0, z) = C_{A0}(z)$

► Flux

$$N_A(t,z) = \underbrace{vC_A(t,z)}^{\text{convection}} \underbrace{-D_A \frac{\partial C_A(t,z)}{\partial z}}_{\text{diffusion}}$$

► Stoichiometry and kinetics

$$A \rightarrow P$$
 $r = kC_A$

▶ Production rates

$$R_A = -r$$

► Equidistant spatial discretization

$$z_j = \left(j - \frac{1}{2}\right)\Delta z$$
 $\Delta z = \frac{L}{N_z}$

► Spatial discretization of partial differential equation (method of lines)

$$\frac{dC_{A,j}(t)}{dt} = -\frac{N_{A,j+1/2}(t) - N_{A,j-1/2}(t)}{\Delta z} + R_{A,j}(t) \qquad j = 1, 2, \dots, N_z$$

► Fluxes

$$\begin{split} N_{A,j+1/2}(t) &= vC_{A,in}(t) & j = 0 \\ N_{A,j+1/2}(t) &= vC_{A,j}(t) - D_A \frac{C_{A,j+1}(t) - C_{A,j}(t)}{\Delta z} & j = 1, 2, \dots, N_z - 1 \\ N_{A,j+1/2}(t) &= vC_{A,j}(t) & j = N_z \end{split}$$

Reaction rates

$$r_i(t) = kC_{A,i}(t)$$
 $j = 1, 2, \dots, N_z$

► Production rates

$$R_{A,j}(t) = -r_j(t)$$
 $j = 1, 2, \dots, N_z$

The model

Equidistant spatial discretization

$$z_j = \left(j - \frac{1}{2}\right) \Delta z \qquad \Delta z = \frac{L}{N_z}$$

► Spatial discretization of partial differential equation (method of lines)

$$\frac{dC_{A,j}(t)}{dt} = -\frac{N_{A,j+1/2}(t) - N_{A,j-1/2}(t)}{\Delta z} + R_{A,j}(t) \qquad j = 1, 2, \dots, N_z$$

► Fluxes

$$\begin{split} N_{A,j+1/2}(t) &= vC_{A,in}(t) & j = 0 \\ N_{A,j+1/2}(t) &= vC_{A,j}(t) - D_A \frac{C_{A,j+1}(t) - C_{A,j}(t)}{\Delta z} & j = 1, 2, \dots, N_z - 1 \\ N_{A,j+1/2}(t) &= vC_{A,j}(t) & j = N_z \end{split}$$

► Reaction rates

$$r_j(t) = kC_{A,j}(t)$$
 $j = 1, 2, ..., N_z$

► Production rates

$$R_{A,j}(t) = -r_j(t)$$
 $j = 1, 2, \dots, N_z$

can be represented as

$$\dot{x}(t) = f(x(t), u(t)) \qquad x(t_0) = x_0$$

$$y(t) = q(x(t))$$

with
$$x=[C_{A,1};\,C_{A,2};\,\dots,C_{A,N_z}]$$
, $u=C_{A,in}$, and $y=C_{A,out}=C_{A,N_z}$

Differential Equations

Ordinary Differential Equation (ODE) System

System of ordinary differential equations

$$\frac{d}{dt} \begin{bmatrix} x_1(t) \\ x_2(t) \\ \vdots \\ x_n(t) \end{bmatrix} = \begin{bmatrix} f_1(t, x_1(t), x_2(t), \dots, x_n(t)) \\ f_2(t, x_1(t), x_2(t), \dots, x_n(t)) \\ \vdots \\ f_n(t, x_1(t), x_2(t), \dots, x_n(t)) \end{bmatrix}$$
(5)

▶ in compact notation

$$\frac{d}{dt}x(t) = f(t, x(t)) \tag{6}$$

▶ using the dot-notation

$$\dot{x}(t) = f(t, x(t)) \tag{7}$$

Classes of Differential Equations

Ordinary Differential Equation (ODE)

$$\frac{d}{dt}x(t) = f(t, x(t)) \quad \text{or} \quad \dot{x}(t) = f(t, x(t)) \tag{8}$$

- ► Differential Algebraic Equation (DAE)
 - ► Generalized Differential Equation

$$\frac{d}{dt}g(t,y(t)) = f(t,y(t)) \tag{9}$$

This is identical to the differential algebraic equation

$$x(t) = g(t, y(t)) \tag{10a}$$

$$\dot{x}(t) = f(t, y(t)) \tag{10b}$$

Differential Algebraic Equation in Semi-Explicit form

$$G(t, x(t), y(t)) = 0 ag{11a}$$

$$\dot{x}(t) = F(t, y(t)) \tag{11b}$$

Fully Implicit Differential Algebraic Equations

$$R(t, x(t), \dot{x}(t)) = 0$$
 (12)

Autonomous vs Non-Autonomous Differential Equation

► Non-Autonomous ODE

$$\dot{x}(t) = f(t, x(t)) \tag{13}$$

► Autonomous ODE

$$\dot{x}(t) = f(x(t)) \tag{14}$$

A non-autonmous ODE can always be converted to an autonomous ODE by augmenting the state $y=\begin{bmatrix}x\\t\end{bmatrix}$. Note that $\dot{t}=\frac{d}{dt}t=1$. Consequently, the non-autonomous ODE, $\dot{x}(t)=f(t,x(t))$, can be expressed as

$$\dot{y}(t) = \begin{bmatrix} \dot{x} \\ \dot{t} \end{bmatrix} = \begin{bmatrix} f(t, x(t)) \\ 1 \end{bmatrix} = F(y(t)),$$

which is an autonomous ODE (system).

Classes of Autonomous Differential Equations

Ordinary Differential Equation (ODE)

$$\frac{d}{dt}x(t) = f(x(t)) \quad \text{or} \quad \dot{x}(t) = f(x(t)) \tag{15}$$

- Differential Algebraic Equation (DAE)
 - ► Generalized Differential Equation

$$\frac{d}{dt}g(y(t)) = f(y(t)) \tag{16}$$

This is identical to the differential algebraic equation

$$x(t) = g(y(t)) \tag{17a}$$

$$\dot{x}(t) = f(y(t)) \tag{17b}$$

Differential Algebraic Equation in Semi-Explicit form

$$G(x(t), y(t)) = 0 (18a)$$

$$\dot{x}(t) = F(y(t)) \tag{18b}$$

► Fully Implicit Differential Algebraic Equations

$$R(x(t), \dot{x}(t)) = 0 \tag{19}$$

Autonomous Differential Equations with a Forcing Function

► Ordinary Differential Equation (ODE)

$$\frac{d}{dt}x(t) = f(x(t), u(t)) \quad \text{or} \quad \dot{x}(t) = f(x(t), u(t)) \tag{20}$$

- ► Differential Algebraic Equation (DAE)
 - ► Generalized Differential Equation

$$\frac{d}{dt}g(y(t)) = f(y(t), u(t)) \tag{21}$$

This is identical to the differential algebraic equation

$$x(t) = g(y(t)) \tag{22a}$$

$$\dot{x}(t) = f(y(t), u(t)) \tag{22b}$$

► Differential Algebraic Equation in Semi-Explicit form

$$G(x(t), y(t)) = 0 (23a)$$

$$\dot{x}(t) = F(y(t), u(t)) \tag{23b}$$

Fully Implicit Differential Algebraic Equations

$$R(x(t), \dot{x}(t), u(t)) = 0$$
 (24)

Autonomous Differential Equations - General Form

► Ordinary Differential Equation (ODE)

$$\frac{d}{dt}x(t) = f(x(t), u(t), p) \quad \text{or} \quad \dot{x}(t) = f(x(t), u(t), p) \quad (25)$$

- Differential Algebraic Equation (DAE)
 - ► Generalized Differential Equation

$$\frac{d}{dt}g(y(t),p) = f(y(t),u(t),p) \tag{26}$$

This is identical to the differential algebraic equation

$$x(t) = g(y(t), p) \tag{27a}$$

$$\dot{x}(t) = f(y(t), u(t), p) \tag{27b}$$

► Differential Algebraic Equation in Semi-Explicit form

$$G(x(t), y(t), p) = 0 (28a)$$

$$\dot{x}(t) = F(y(t), u(t), p) \tag{28b}$$

Fully Implicit Differential Algebraic Equations

$$R(x(t), \dot{x}(t), u(t), p) = 0$$
 (29)

Autonomous ODE Systems - Different Representations

► ODE standard form

$$\dot{x}(t) = f(x(t)) \tag{30}$$

► ODE with a forcing function

$$\dot{x}(t) = f(x(t), u(t)) \tag{31}$$

► ODE with parameters

$$\dot{x}(t) = f(x(t), p) \tag{32}$$

▶ ODE with a forcing function and parameters

$$\dot{x}(t) = f(x(t), u(t), p) \tag{33}$$

Non-Autonomous ODE Systems - Different Representations

► ODE standard form

$$\dot{x}(t) = f(t, x(t)) \tag{34}$$

► ODE with a forcing function

$$\dot{x}(t) = f(t, x(t), u(t)) \tag{35}$$

► ODE with parameters

$$\dot{x}(t) = f(t, x(t), p) \tag{36}$$

► ODE with a forcing function and parameters

$$\dot{x}(t) = f(t, x(t), u(t), p)$$
 (37)

Autonomous ODE and basic numerical solution methods

► Initial value problem (IVP)

$$x(t_0) = \bar{x}_0, \tag{38}$$

$$\dot{x}(t) = f(x(t)), \quad t_0 \le t \le t_N = t_f$$
 (39)

▶ Discrete times

$$t_0 < t_1 < t_2 < \dots < t_N = t_f$$
 (40)

▶ Time steps

$$\Delta t_k = t_{k+1} - t_k, \qquad k = 0, 1, \dots, N - 1$$
 (41)

▶ Numerical solutions: $x_k = x(t_k)$

Initial:
$$x_0 = \bar{x}_0$$
 (42)

Explicit:
$$x_{k+1} - x_k = f(x_k)\Delta t_k$$
, $k = 0, 1, ..., N-1$ (43)

Implicit: $x_{k+1} - x_k = f(x_{k+1})\Delta t_k, k = 0, 1, \dots, N-1$ (44)

Explicit Solution Methods

System of ordinary differential equations (ODEs)

$$\dot{x}(t) = f(x(t)) \tag{45}$$

► Integral form

$$x(t_{k+1}) - x(t_k) = \int_{t_k}^{t_{k+1}} f(x(t))dt$$
 (46)

► Explicit numerical method

$$x_{k+1} - x_k = f(x_k)\Delta t_k \tag{47}$$

with $\Delta t_k = t_{k+1} - t_k$

► Numerical procedure

$$x_{k+1} = x_k + f(x_k)\Delta t_k \tag{48}$$

Implicit Solution Methods

► System of ordinary differential equations (ODEs)

$$\dot{x}(t) = f(x(t)) \tag{49}$$

► Integral form

$$x(t_{k+1}) - x(t_k) = \int_{t_k}^{t_{k+1}} f(x(t))dt$$
 (50)

► Implicit numerical method

$$x_{k+1} - x_k = f(x_{k+1})\Delta t_k (51)$$

with $\Delta t_k = t_{k+1} - t_k$

► Numerical procedure: Solve

$$R_k(x_{k+1}) = x_{k+1} - f(x_{k+1})\Delta t_k - x_k = 0$$
 (52)

by a Newton method.

Differential Equations with Discrete Events

Differential equations with discrete events are systems of differential equations where we have one set of model equations, $f_I(t,x(t))$, in one set of the state space, $g(t,x(t))\geq 0$, and another set of equations, $f_{II}(t,x(t))$, in the other set of the state space, g(t,x(t))<0. Such a model may be denoted

$$\dot{x}(t) = \begin{cases} f_I(t, x(t)) & g(t, x(t)) \ge 0\\ f_{II}(t, x(t)) & g(t, x(t)) < 0 \end{cases}$$
 (53)

where g(t,x(t)) is called the discrete event function. Examples

- ► Bouncing ball
- ► Tank with overflow
- ► Phase equilibrium systems with appearance/disappearance of phases

Differential Equations and Uncertainty Quantification

► Initial value problem (IVP)

$$\boldsymbol{x}(t_0) = \boldsymbol{x}_0 \tag{54}$$

$$\dot{\boldsymbol{x}}(t) = f(\boldsymbol{x}(t), \boldsymbol{p}), \qquad t_0 \le t \le t_f \tag{55}$$

► Uncertain initial conditions

$$\mathbf{x}_0 \sim N(\bar{x}_0, P_0) \qquad \Rightarrow \qquad \left\{ x_0^i \right\}_{i=1}^{N_x}$$
 (56)

▶ Uncertain Parameters

$$p \sim N(\bar{p}, R_p) \qquad \Rightarrow \qquad \left\{ p^j \right\}_{j=1}^{N_p}$$
 (57)

► Solution for uncertain initial conditions and parameters

$$x^{(i,j)}(t_0) = x_0^i (58)$$

$$\dot{x}^{(i,j)}(t) = f(x^{(i,j)}(t), p^j), \qquad t_0 \le t \le t_f$$
 (59)

These $N_x \times N_p$ systems of differential equations may be solved in parallel

Stochastic Differential Equations (SDEs)

► The stochastic system of differential equations is denoted as

$$d\mathbf{x}(t) = \overbrace{f(\mathbf{x}(t))dt}^{\text{drift term}} + \overbrace{g(\mathbf{x}(t))d\mathbf{w}(t)}^{\text{diffusion term}}$$
(60)

► Integral form

$$\boldsymbol{x}(t_{k+1}) - \boldsymbol{x}(t_k) = \overbrace{\int_{t_k}^{t_{k+1}} f(\boldsymbol{x}(t)) dt}^{\text{Riemann integral}} + \overbrace{\int_{t_k}^{t_{k+1}} g(\boldsymbol{x}(t)) d\boldsymbol{w}(t)}^{\text{Ito integral}}$$
(61)

Numerical methods

explicit-explicit:
$$x_{k+1} - x_k = f(x_k)\Delta t_k + g(x_k)\Delta w_k$$
 (62)

implicit-explicit:
$$x_{k+1} - x_k = f(x_{k+1})\Delta t_k + g(x_k)\Delta w_k$$
 (63)

▶ $\{w(t)\}$ is a standard Wiener process. This implies $dw(t) \sim N_{iid}(0, Idt)$ such that $\Delta w_k \sim N_{iid}(0, I\Delta t_k)$

Linear Systems of Differential Equations

► Scalar (real)

$$\dot{x}(t) = \lambda x(t), \quad x(0) = x_0, \quad \lambda \in \mathbb{R}$$
 (64)

► Scalar (complex)

$$\dot{x}(t) = \lambda x(t), \quad x(0) = x_0, \quad \lambda \in \mathbb{C}$$
 (65)

Multi dimensional

$$\dot{x}(t) = \Lambda x(t), \quad x(0) = x_0, \quad \Lambda \in \mathbb{R}^{n \times n}$$
 (66)

► Scalar stochastic differential equation (SDE)

$$d\mathbf{x}(t) = \lambda \mathbf{x}(t)dt + \sigma d\boldsymbol{\omega}(t) \tag{67}$$

► Scalar SDE - state dependent diffusion

$$dx(t) = \lambda x(t)dt + \sigma x(t)d\omega(t)$$
 (68)

The Harmonic Oscillator Problem

► Physics – mass-spring system

$$m\ddot{x}(t) = -kx(t) \tag{69}$$

► Mathematical model - 2nd order differential equation

$$\ddot{x}(t) = -\beta x(t) \qquad \beta = \frac{k}{m} \tag{70}$$

► First order system of differential equations

$$x_1 = x$$
 $\dot{x}_1 = \dot{x}$ $\dot{x}_1(t) = x_2(t)$ (71)

$$x_2 = \dot{x}$$
 $\dot{x}_2 = \ddot{x}$ $\dot{x}_2(t) = -\beta x_1(t)$ (72)

► Matrix form $(\dot{x}(t) = Ax(t))$

$$\frac{d}{dt} \begin{bmatrix} x_1(t) \\ x_2(t) \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -\beta & 0 \end{bmatrix} \begin{bmatrix} x_1(t) \\ x_2(t) \end{bmatrix}$$
 (73)

The Van der Pol Oscillator Problem

► Second order differential equation

$$\ddot{y}(t) = \mu(1 - y(t)^2)\dot{y}(t) - y(t) \tag{74}$$

► Equivalent system of first order differential equations

$$\dot{x}_1(t) = x_2(t) \tag{75}$$

$$\dot{x}_2(t) = \mu(1 - x_1(t)^2)x_2(t) - x_1(t) \tag{76}$$

Version for optimal control problems

$$\dot{x}_1(t) = x_2(t) \tag{77}$$

$$\dot{x}_2(t) = \mu(1 - x_1(t)^2)x_2(t) - x_1(t) + u(t) \tag{78}$$

SDE version (state independent diffusion)

$$d\mathbf{x}_1(t) = \mathbf{x}_2(t)dt + \sigma_{11}d\mathbf{\omega}_1(t)$$
(79)

$$dx_2(t) = \left[\mu (1 - x_1(t)^2) x_2(t) - x_1(t) \right] dt + \sigma_{22} d\omega_2(t)$$
 (80)

► SDE version (state dependent diffusion)

Classes of Partial Differential Equations - 1D

Hyperbolic PDE

$$\frac{\partial}{\partial t}s(t,x) = -\frac{\partial}{\partial x}s(t,x) + f(t,x) \tag{81}$$

► Parabolic PDE

$$\frac{\partial}{\partial t}s(t,x) = \frac{\partial^2}{\partial x^2}s(t,x) + f(t,x)$$
 (82)

► Elliptic PDE

$$0 = \frac{\partial^2}{\partial x^2} s(t, x) + f(t, x) \tag{83}$$

Classes of Partial Differential Equations - 2D

► Hyperbolic PDE

$$\frac{\partial}{\partial t}s(t,x,y) = -\left(\frac{\partial}{\partial x}s(t,x,y) + \frac{\partial}{\partial y}s(t,x,y)\right) + f(t,x,y) \quad (84)$$

► Parabolic PDE

$$\frac{\partial}{\partial t}s(t,x,y) = \left(\frac{\partial^2}{\partial x^2}s(t,x,y) + \frac{\partial^2}{\partial y^2}s(t,x,y)\right) + f(t,x,y) \quad (85)$$

▶ Elliptic PDE

$$0 = \left(\frac{\partial^2}{\partial x^2}s(t, x, y) + \frac{\partial^2}{\partial y^2}s(t, x, y)\right) + f(t, x, y)$$
 (86)

Classes of Partial Differential Equations - 3D

► Hyperbolic PDE

$$\frac{\partial}{\partial t}s(t,x,y,z) = -\left(\frac{\partial}{\partial x}s(t,x,y,z) + \frac{\partial}{\partial y}s(t,x,y,z) + \frac{\partial}{\partial z}s(t,x,y,z)\right) + f(t,x,y,z)$$
(87)

Parabolic PDE

$$\frac{\partial}{\partial t}s(t,x,y,z) = \left(\frac{\partial^2}{\partial x^2}s(t,x,y,z) + \frac{\partial^2}{\partial y^2}s(t,x,y,z) + \frac{\partial^2}{\partial z^2}s(t,x,y,z)\right) + f(t,x,y)$$
(88)

► Elliptic PDE

$$0 = \left(\frac{\partial^2}{\partial x^2}s(t, x, y, z) + \frac{\partial^2}{\partial y^2}s(t, x, y, z) + \frac{\partial^2}{\partial z^2}s(t, x, y, z)\right) + f(t, x, y, z)$$
(89)

Classes of Partial Differential Equations - General

► Hyperbolic PDE

$$\frac{\partial}{\partial t}s(t,x) = -\nabla \cdot es(t,x) + f(t,x) \qquad e = \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix}$$
 (90)

► Parabolic PDE

$$\frac{\partial}{\partial t}s(t,x) = \nabla \cdot (\nabla s(t,x)) + f(t,x) \tag{91}$$

► Elliptic PDE

$$0 = \nabla \cdot (\nabla s(t, x)) + f(t, x) \tag{92}$$

Convection-Diffusion-Reaction PDE - 1D

Mass balance

$$\frac{\partial}{\partial t}C_{i}(t,x) = \underbrace{-\frac{\partial}{\partial x}F_{x,i}(t,x)}_{\text{transport (flux)}} + \underbrace{R_{i}(t,x)}_{\text{reaction}}$$
(93)

Flux

$$F_{x,i}(t,x) = \underbrace{v_x(t,x)C_i(t,x)}_{\text{convection}} + \underbrace{J_{x,i}(t,x)}_{\text{diffusion}} \tag{94}$$

Diffusion (Fick's law)

$$J_{x,i}(t,x) = -D_i(t,x)\frac{\partial}{\partial x}C_i(t,x)$$
(95)

$$R_i(t,x) = \sum_{j \in \mathcal{R}} \nu_{ij} r_j(C(t,x))$$
(96)

Convection-Diffusion-Reaction PDE - 2D

Mass balance

$$\frac{\partial}{\partial t}C_{i}(t,x,y) = \overbrace{-\left(\frac{\partial}{\partial x}F_{x,i}(t,x,y) + \frac{\partial}{\partial y}F_{y,i}(t,x,y)\right)}^{\text{transport (flux)}} + \overbrace{R_{i}(t,x,y)}^{\text{reaction}}$$
(97)

Flux

$$F_{x,i}(t,x,y) = \underbrace{v_x(t,x,y)C_i(t,x,y)}_{\text{convection}} + \underbrace{J_{x,i}(t,x,y)}_{\text{diffusion}}$$
 (98a)

$$F_{y,i}(t,x,y) = \underbrace{v_y(t,x,y)C_i(t,x,y)}_{U_i(t,x,y)} + \underbrace{J_{y,i}(t,x,y)}_{J_{y,i}(t,x,y)}$$
(98b)

Diffusion (Fick's law)

$$J_{x,i}(t,x,y) = -D_i(t,x,y)\frac{\partial}{\partial x}C_i(t,x,y)$$
(99a)

$$J_{y,i}(t,x,y) = -D_i(t,x,y)\frac{\partial}{\partial y}C_i(t,x,y) \tag{99b}$$

$$R_i(t, x, y) = \sum_{j \in \mathcal{R}} \nu_{ij} r_j(C(t, x, y))$$
(100)

Convection-Diffusion-Reaction PDE - 3D

Mass balance

$$\frac{\partial}{\partial t}C_{i}(t,x,y,z) = \overbrace{-\left(\frac{\partial}{\partial x}F_{x,i}(t,x,y,z) + \frac{\partial}{\partial y}F_{y,i}(t,x,y,z) + \frac{\partial}{\partial z}F_{z,i}(t,x,y,z)\right)}^{\text{transport (fflux)}} + \overbrace{R_{i}(t,x,y,z)}^{\text{reaction}}$$

$$(101)$$

Flux

$$F_{x,i}(t,x,y,z) = \overbrace{v_x(t,x,y,z)C_i(t,x,y,z)}^{\text{convection}} + \overbrace{J_{x,i}(t,x,y,z)}^{\text{diffusion}}$$
 (102a)

$$F_{y,i}(t,x,y,z) = \overbrace{v_y(t,x,y,z)C_i(t,x,y,z)}^{\text{Collifection}} + \overbrace{J_{y,i}(t,x,y,z)}^{\text{Unifusion}}$$
 (102b)

$$F_{z,i}(t,x,y,z) = \overbrace{v_z(t,x,y,z)C_i(t,x,y,z)} + \overbrace{J_{z,i}(t,x,y,z)}$$
(102c)

Diffusion (Fick's law)

$$J_{x,i}(t,x,y,z) = -D_i(t,x,y,z)\frac{\partial}{\partial x}C_i(t,x,y,z)$$
(103a)

diffusion

$$J_{y,i}(t,x,y,z) = -D_i(t,x,y,z) \frac{\partial}{\partial y} C_i(t,x,y,z)$$
 (103b)

$$J_{z,i}(t,x,y,z) = -D_i(t,x,y,z) \frac{\partial}{\partial z} C_i(t,x,y,z)$$
 (103c)

$$R_i(t, x, y, z) = \sum_{j \in \mathcal{R}} \nu_{ij} r_j (C(t, x, y, z))$$
 (104)

Convection-Diffusion-Reaction PDE - General Mass balance

$$\frac{\partial}{\partial t}C_i(t,x) = \underbrace{-\nabla \cdot F_i(t,x)}_{\text{transport (flux)}} + \underbrace{R_i(t,x)}_{\text{reaction}}$$
(105)

Flux

$$F_i(t,x) = \overbrace{v(t,x)C_i(t,x)}^{\text{convection}} + \overbrace{\nabla J_i(t,x)}^{\text{diffusion}} \tag{106}$$

Diffusion (Fick's law)

$$J_i(t,x) = -D_i(t,x)\nabla C_i(t,x)$$
(107)

$$R_i(t,x) = \sum_{j \in \mathcal{R}} \nu_{ij} r_j(C(t,x))$$
(108)

Schrödinger's Equation - The Wave Function - Quantum Mechanics
The 1-dimensional time-dependent Schrödinger equation is

$$i\hbar \frac{\partial \psi}{\partial t} = \mathcal{H}\psi \tag{109}$$

with $\psi = \psi(t,x)$ being the wave function. The wave function is complex

$$\psi = \psi_{Re} + i\psi_{Im} \tag{110}$$

and $|\psi|^2=\psi^*\psi$ is a probability density function such that

$$\int_{-\infty}^{\infty} |\psi(t,x)|^2 dx = 1 \tag{111}$$

The Hamiltonian operator is

$$\mathcal{H} = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + V(x) \tag{112}$$

with V(x) being the potential function (in this case independent of time, t), $\hbar = h/(2\pi)$ with h being Planck's constant, and m the mass of the particle.

Maxwell's Equations - Electromagnetism

► The electric flux leaving a volume is proportional to the charge inside

$$\nabla \cdot E = \frac{\rho}{\varepsilon_0} \tag{113}$$

► The total magnetic flux through a closed surface is zero

$$\nabla \cdot B = 0 \tag{114}$$

► The voltage induced in a closed loop is proportional to the rate of change of the magnetic flux the the loop encloses

$$\nabla \times E = -\frac{\partial B}{\partial t} \tag{115}$$

► The magnetic field induced around a closed loop is proportional to the electric current plus displacement current that the loop encloses

$$\nabla \times B = \mu_0 \left(J + \varepsilon_0 \frac{\partial E}{\partial t} \right) \tag{116}$$

Navier-Stoke Equations - Computational Fluid Dynamics

▶ Momentum balance (Newtonian fluid, constant μ and ρ)

$$\rho \frac{D\boldsymbol{v}}{Dt} = -\nabla p + \mu \nabla^2 \boldsymbol{v} + \rho \boldsymbol{g} \tag{117}$$

$$\frac{D\boldsymbol{v}}{Dt} = \frac{\partial \boldsymbol{v}}{\partial t} + \boldsymbol{v} \cdot \nabla \boldsymbol{v} \tag{118}$$

▶ Energy balance (Newtonian fluid, constant ρ and k)

$$\rho \hat{C}_p \frac{DT}{Dt} = k \nabla^2 T + \mu \Phi_v \tag{119}$$

$$\frac{DT}{Dt} = \frac{\partial T}{\partial t} + \boldsymbol{v} \cdot \nabla T \tag{120}$$

▶ Mass balance (binary mixture, constant ρD_{AB})

$$\rho \frac{D\omega_A}{Dt} = \rho D_{AB} \nabla^2 \omega_A + r_A \tag{121}$$

$$\frac{D\omega_A}{Dt} = \frac{\partial \omega_A}{\partial t} + \boldsymbol{v} \cdot \nabla \omega_A \tag{122}$$

Thermodynamic Process Systems and Phase Equilibrium

► Mass and energy conservation (1st law of thermodynamics)

$$\dot{n}_i = f_i - l_i(T, P, n_l) - v_i(T, P, n_v) \qquad i = 1, \dots, N_C$$
 (123)

$$\dot{U} = H_F - H_L(T, P, n^l) + H_V(T, P, n^v) + Q + W_s \tag{124}$$

► Vapor-liquid equilibrium (2nd law of thermodynamics)

$$\max_{T,P,n^l,n^v} S = S^l(T,P,n^l) + S^v(T,P,n^v)$$
(125)

s.t.
$$U^{l}(T, P, n^{l}) + U^{v}(T, P, n^{v}) = U$$
 (126)

$$V^{l}(T, P, n^{l}) + V^{v}(T, P, n^{v}) = V$$
(127)

$$n_i^l + n_i^v = n_i$$
 $i = 1, \dots, N_C$ (128)

Mathematical representation as semi-explicit DAE system

$$\dot{x} = F(y) \tag{129}$$

$$G(x, y, z) = 0 \tag{130}$$

Semi-explicit DAE systems occurs for equilibrium governed processes

Problem Types

Basic Problem Types (ODE Systems)

► Initial Value Problem (IVP)

$$x(t_a) = x_a \tag{131a}$$

$$\dot{x}(t) = f(x(t)) \quad t_a \le t \le t_b \tag{131b}$$

Compute $x_b = x(t_b)$ - that satisfies (131).

► Boundary Value Problem (BVP)

$$x(t_a) = x_a(p) \tag{132a}$$

$$\dot{x}(t) = f(x(t)) \quad t_a \le t \le t_b \tag{132b}$$

$$x(t_b) = x_b(p) \tag{132c}$$

Compute p - that satisfies (132).

Advanced Problem Types (ODE Systems) - IVP

Mean-Covariance Pair [IVP] From the initial conditions, $\hat{x}_k(t_k) = \hat{x}_{k|k}$ and $P_k(t_k) = P_{k|k}$, solve

$$\frac{d}{dt}\hat{x}_k(t) = f(\hat{x}_k(t)) \tag{133a}$$

$$\frac{d}{dt}P_k(t) = \left[\frac{\partial f}{\partial x}(\hat{x}_k(t))\right]P_k(t) + P_k(t)\left[\frac{\partial f}{\partial x}(\hat{x}_k(t))\right]' + \sigma\sigma'$$
(133b)

in the interval $t \in [t_k, t_{k+1}]$ to obtain

$$\hat{x}_{k+1|k} = \hat{x}_k(t_{k+1})$$
 and $P_{k+1|k} = P_k(t_{k+1})$.

► Sensitivities [IVP]

$$\dot{x}(t) = f(x(t), p), \qquad x(t_a) = x_a(p)$$
(134a)

$$\dot{S}_p(t) = \frac{\partial f}{\partial x}(x(t), p)S_p(t) + \frac{\partial f}{\partial p}(x(t), p), \quad S_p(t_a) = \frac{\partial}{\partial p}x_a(p) \tag{134b}$$

Lyapunov Differential Equation [IVP]

$$\dot{P}(t) = A'P(t) + P(t)A + Q, \quad P(t_a) = P_a$$
(135)

► Riccati Differential Equation [IVP]

$$\dot{P}(t) = A'P(t) + P(t)A + Q - P(t)BR^{-1}B'P(t), \quad P(0) = P_N$$
 (136)

Compute $P_0 = P(T)$

Optimal Control Problem (OCP)

▶ Bolza form

$$\min_{x(\cdot),u(\cdot)} \quad \phi = \int_{t_a}^{t_b} g(x(t),u(t))dt + h(x(t_b))$$

$$s.t. \quad x(t_a) = x_a$$

$$\dot{x}(t) = f(x(t),u(t))$$

$$t_a < t < t_b$$
(137a)
$$(137b)$$

► Lagrange form

$$\min_{x(\cdot),u(\cdot)} \quad \phi = \int_{t_a}^{t_b} g(x(t),u(t))dt$$

$$s.t. \quad x(t_a) = x_a$$
(138a)

$$\dot{x}(t) = f(x(t), u(t)) \qquad t_a \le t \le t_b$$
 (138c)

Mayer form

Optimal Control Problem (OCP) in Bolza Form

$$\min_{x(\cdot),u(\cdot)} \quad \phi = \int_{t_a}^{t_b} g(x(t),u(t))dt + h(x(t_b))$$

$$s.t. \qquad x(t_a) = x_a$$

$$\dot{x}(t) = f(x(t),u(t)) \qquad t_a \le t \le t_b$$

$$(140a)$$

▶ The Hamiltonian

$$\mathcal{H} = \mathcal{H}(x(t), u(t), \lambda(t))$$

$$= g(x(t), u(t)) + \lambda(t)' f(x(t), u(t))$$
(141)

► The Euler-Lagrange equations System of differential equations that defines the optimal solution

Numerical Methods (Solvers)

Explicit Solvers - Nonstiff Systems

► Initial value problem (IVP)

$$x(t_0) = \bar{x}_0 \tag{142}$$

$$\dot{x}(t) = f(x(t)) \tag{143}$$

Explicit Euler method

$$x_0 = \bar{x}_0 \tag{144}$$

$$x_{k+1} = x_k + f(x_k)\Delta t_k \tag{145}$$

Implicit Solvers - Stiff Systems

► Initial value problem (IVP)

$$x(t_0) = \bar{x}_0 \tag{146}$$

$$\dot{x}(t) = f(x(t)) \tag{147}$$

► Implicit Euler method

$$x_0 = \bar{x}_0 \tag{148}$$

$$x_{k+1} = x_k + f(x_{k+1})\Delta t_k (149)$$

Solve

$$R_k(x_{k+1}) = x_{k+1} - f(x_{k+1})\Delta t_k - x_k = 0$$
(150)

using a variant of Newton's method (Newton-Raphson)

Newton's Method

► Nonlinear system of equations

$$R_k(x_{k+1}) = x_{k+1} - f(x_{k+1})\Delta t_k - x_k = 0$$
(151)

► Iteration matrix and Jacobian

$$M_k = \frac{\partial R_k}{\partial x_{k+1}} = I - J(x_{k+1})\Delta t_k, \quad J(x_{k+1}) = \frac{\partial f}{\partial x}(x_{k+1})$$
(152)

▶ Linear system (Ax = b)

$$M_k \Delta x_{k+1} = -R_k(x_{k+1}) \tag{153}$$

Updated iterate

$$x_{k+1} := x_{k+1} + \Delta x_{k+1} \tag{154}$$

Convergence

$$||R_k(x_{k+1})|| \le \epsilon \tag{155}$$

Methods for Dense Matrices - Dense LU Factorization

► Linear system of equations

$$Ax = b (156)$$

where $A \in \mathbb{R}^{n \times n}$ is a dense matrix

► LU factorization with pivoting (interchange of rows)

$$PA = LU$$
 Computational complexity: $\mathcal{O}(n^3)$ (157)

Back substitution

$$PAx = L \underbrace{Ux}^{=y} = Pb = \bar{b} \tag{158}$$

Interchange rows:
$$\bar{b} = Pb$$
 $\mathcal{O}(n)$ (159)

Solve for
$$y$$
: $Ly = \bar{b}$ $\mathcal{O}(n^2)$ (160)

Solve for
$$x$$
: $Ux = y$ $\mathcal{O}(n^2)$ (161)

Direct Methods for Sparse Matrices - Sparse LU Factorization

- ► Matlab sparse
- ► Sparse matrix software libraries

Newton Method Variants

- ► The exact Newton method
- ► The inexact Newton method
- ► Sequential substitution

Iterative Methods for Sparse Matrices

- ► Large-scale systems (typical discretization of PDEs)
- ► GMRES with incomple LU (ILU) preconditioner

Implementation (Software)

Programming Languages

High-level programming languages:

- ▶ Matlab
- Octave
- ► Python
- ▶ R
- ► Julia

Low-level programming languages

- ▶ (
- ► Fortran

Object-oriented programming languages

- ► C++
- ▶ Java
- ► C#

Web-oriented languages

▶ Javascript

Modeling Environments

- ► Simulink (Mathworks)
- ► gProms (PSEnterprise)
- ► Modelica (OpenModelica https://openmodelica.org/)

Software Libraries for Solution of Differential Equations

- Matlab
 - ► Nonstiff ODE (ode45, ode23, ode113)
 - ► Stiff ODE (ode15s, ode23s)
 - ► Stiff DAE (ode23t, ode23tb)
 - ► Fully Implicit DAE (ode15i)
- SUNDIALS

SUite of Nonlinear and DIfferential ALgebraic equation Solvers http://computation.llnl.gov/projects/sundials

► NETLIB (www.netlib.org)

Summary and Conclusion

Summary and Conclusion

- ► Non-stiff systems of differential equations
 - ► Typical low dimensional ODEs
 - ► Explicit solver for the system of differential equations (ODEs)
 - Numerical implementation straightforward
- ► Stiff systems of differential equations
 - Implicit solver for the system of differential equations (ODEs, DAEs, spatially discretized PDEs in the MOL)
 - Some Newton based solver (exact, inexact) for the implicit equations
 - Linear system of equations must be solved (Dense, Sparse direct, Sparse iterative)
